Anewgo Release Notes - Nov 10, 2026

Summary of recent features, enhancements, and system improvements for builder teams.

🛠️ Console & Content Dashboard

- **Bulk Media Upload Reliability**: Upload large groups of assets to the Media Library simultaneously without experiencing timeouts or upload failures.
- **Automatic File Naming**: You no longer need to manually rename image/asset files that have spaces or special characters before uploading them.
- **Color Schemes Spreadsheet** Export: Export active color schemes in a horizontal specification sheet format with separate manufacturer and color columns.
- **Community Previews**: Preview floorplans and options directly within community-scoped plan management.
- **Streamlined Lot Management**: Review identifying information and delete a lot directly from Lot Details.
- **Clearer Elevation Choices**: The default elevation selector displays elevation labels, captions, and internal names to make choices easier to distinguish.
- **Scattered Lot Placement Guidance**: Added missing helper text to lot placement controls when adding scattered lots.
- **Inactive Community Previews**: Authenticated users can preview site plans for inactive communities without encountering broken page errors.
- **Reliable Community Plan & Elevation Assignments**: Corrected shared assignment data across cloned plans to prevent duplicate key failures and unintended cross-plan data copying.
- **Scheme-Assignment Search Corrections**: Fixed searches for elevation names containing spaces and clarified empty state messages.
- **Live Collaborator Lock Indicators**: Website page lock indicators update as collaborators start or finish editing, without requiring a refresh.
- **Friendly Elevation Caption Validation**: Clearing a required caption shows a useful validation message instead of a database error.
- **Accurate XML Exclusion Reporting**: Excluded Plans reporting uses the same pricing and fallback rules as XML feeds to show accurate missing data reasons.

🌐 Websites & Marketing App Experience

- **Interactive Experiences on Custom Website Pages**: Embed interactive siteplans, floorplans, exteriors, and interior design experiences directly in custom pages and shared sections.
- **Website Dark Mode Support**: Added Light and Dark theme presets at website and individual section levels for consistent text and backgrounds.

- **Required Registration Names**: Requires visitors to enter a name when creating an account on the website. This fixes an issue where blank name registrations were causing lead data to get rejected when syncing to Lasso CRM.
- **Correct Popup-Close Navigation**: Closing popups on the website no longer jumps back two pages when using the browser back button.
- **Shareable Community Links**: Community selection updates the page URL so refreshes, browser navigation, and shared links retain the selected community.
- **Full Addresses in Map Popups**: Community map popups display full street addresses when available.
- **Multi-Select & Header List Filters**: Added exact value filtering, multiple selections, and control over which existing filters appear in global list page headers.
- **Story & Level Filtering**: Added Story/Level filtering and improved filter relevance by hiding inactive or unassigned tags.
- **Immediate Multi-Select Filter Updates**: Removing filter selections correctly updates results, checkboxes, and filter chips.
- **Custom Terminology Alignment**: Marketing App site plan headings and breadcrumbs use the builder's configured Site Plan terminology.
- **Readable Virtual Tour Links**: Virtual Tour links on Minimalist, Minimalist 2, and Elegant model home cards use the card's contrasting black or white text color for readability.
- **Mirrored Summary and Brochure Imagery**: Summary previews and brochure covers honor the selected mirror orientation even without an exterior color scheme.
- **Mobile Interior Editing**: Tapping the pencil for grouped interior elements on mobile opens their option sublists, matching desktop behavior.
- **Accurate Specification Ranges Starting at Zero**: Corrected zero based garage, square footage, bedroom, and bathroom ranges while retaining existing standalone zero and pricing behavior.

🎨 Sales Center App

- **Alphabetical Location Selectors (Sales Center)**: State and City options now appear alphabetically when selecting a community in the Sales Center.
- **Accurate Sales Center Plan Counts**: Community cards count plans rather than elevations, matching the community plans page.
- **Consistent Sales Center QMI Wording**: QMI callouts use configured builder terminology without an additional hardcoded Available prefix.

📊 Integrations & Data Feeds

- **Homes.com Feed Management**: Full administrative control to specify which communities, plans, and inventory appear in native Homes.com XML feeds.
- **County Information in Lead Integrations**: Build On Your Lot lead webhooks and Lasso integrations now include selected county information.
